

Train Track Construction Notes

1. Begin by slotting the Ties into one of the Bases and glue in place.
2. Then glue Rails into the notches in the Ties. The flanges in the Ties will self-align them and they should lay flush against the surface of the Base. Repeat for the other Track sections.

Pay close attention to the connectors at the ends of the Rails! Be sure both Rails have the same connector at each end (opposed to one being turned backwards), or your Track sections will not connect together properly!
